

GitHub-Ready Location.js

Prepared from the uploaded MongoDB/Mongoose model. The file contains no hard-coded credentials, so its functionality is preserved for GitHub upload.

```
const mongoose = require('mongoose');

const locationSchema = new mongoose.Schema({
  city: {
    type: String,
    required: [true, 'Please provide a city name'],
    trim: true
  },
  country: {
    type: String,
    required: [true, 'Please provide a country name'],
    trim: true
  },
  user: {
    type: mongoose.Schema.Types.ObjectId,
    ref: 'User',
    required: [true, 'User reference is required']
  }
}, {
  timestamps: true
});

// Ensure a user cannot duplicate the exact same city and country in their favorites
locationSchema.index({ user: 1, city: 1, country: 1 }, { unique: true });

const Location = mongoose.model('Location', locationSchema);
module.exports = Location;
```

GitHub upload: save this as **Location.js** (or use your project's existing filename) inside the models folder. Keep secrets and environment files such as **.env** out of GitHub.
