

GitHub-Ready User.js

Prepared from the uploaded Mongoose User model. It defines user validation, password hashing with bcrypt, and password comparison, with no hard-coded credentials.

```
const mongoose = require('mongoose');
const bcrypt = require('bcryptjs');

const userSchema = new mongoose.Schema({
  name: {
    type: String,
    required: [true, 'Please provide a name'],
    trim: true
  },
  email: {
    type: String,
    required: [true, 'Please provide an email'],
    unique: true,
    trim: true,
    lowercase: true,
    match: [
      /^\.w+([\.-]?\w+)*@\w+([\.-]?\w+)*(\.w{2,3})+$/,
      'Please provide a valid email address'
    ]
  },
  password: {
    type: String,
    required: [true, 'Please provide a password'],
    minlength: [6, 'Password must be at least 6 characters']
  }
}, {
  timestamps: true
});

// Pre-save hook to hash password
userSchema.pre('save', async function(next) {
  if (!this.isModified('password')) {
    return next();
  }
  try {
    const salt = await bcrypt.genSalt(10);
    this.password = await bcrypt.hash(this.password, salt);
    next();
  } catch (error) {
    next(error);
  }
});

// Instance method to compare password
userSchema.methods.comparePassword = async function(candidatePassword) {
  return await bcrypt.compare(candidatePassword, this.password);
};

const User = mongoose.model('User', userSchema);
module.exports = User;
```

GitHub upload: save this as **User.js** in your models folder. Keep environment files such as **.env** out of the repository.
