

GitHub-Ready authRoutes.js

Prepared from the uploaded Express authentication routes. The routes handle registration, login, and the protected user profile endpoint.

```
const express = require('express');
const router = express.Router();
const { registerUser, loginUser, getUserProfile } = require('../controllers/authController');
const { protect } = require('../middleware/authMiddleware');

router.post('/register', registerUser);
router.post('/login', loginUser);
router.get('/profile', protect, getUserProfile);

module.exports = router;
```

GitHub upload: save this as **authRoutes.js** in your routes folder. No hard-coded credentials are present in this file.
